

# Leak Testing

Last Updated: January 13 2025

**Leak Found**

**Leak Fixed**

1. Make soapy water using soap WITHOUT oils or animal fat. If soap with fat or oils is used, it could create a fire hazard
2. Soak a clean cloth in the soapy water and wring it out on the piping joint. Or pour the soapy water directly on the piping joint.
3. If there is an air or oxygen leak, the soap will start to bubble up.
4. If there is a leak, tighten the union and do the soapy water test again until no more bubbles form.
